The Honorable Christine C. Quinn  
Speaker, City Council of New York  
250 Broadway, Room 185  
New York, NY 10007  

July 31, 2012

Dear Speaker Quinn,

We are following up on the letter sent to you several weeks ago from a large group of concerned organizations, businesses, legislators, residential groups and health professionals regarding having joint Health and Environment committees City Council hearings on radon in natural gas from Marcellus sources coming to NYC.

Since we have not had a response, we are re-sending our original letter to you, as well as this summary with additional signatories we have collected since the letter was sent to you on June 1st. In addition to the individual signatories who have signed this letter since June 1st, 16 block associations and larger residential associations, legislators, and more businesses have shown their growing concern over radon in incoming natural gas and desire for further information that would be provided by a hearing. The list of businesses includes health professionals, restaurants, and professional business people of all sorts.

Some of the public health, financial and other concerns that need exploration in a hearing are the following:

- the potential for exposing every New York household that uses natural gas to dangerous levels of radioactive radon;
- the potential health impacts to vulnerable sectors of the public especially children, and to some workers, namely maintenance, subway, and restaurant workers;
- the risk of thousands of additional cases of lung cancer must receive a proper health assessment;
- potential financial risks to the City and Con Ed;
- lack of definitive information in the public documents as to when, from where and how Marcellus shale gas will be brought into the City via various pipelines including the new Spectra pipeline;
• the issue of radon pollution in natural gas has been ignored in environmental impact documents and further brushed aside by the FERC in its public hearing processes;
• what, if any, options are there to protect public health.

Radon hazards NY Times article  http://www.nytimes.com/2012/03/29/opinion/

To summarize our request, we again respectfully ask that the New York City Council Committee on the Environment and Committee on Health are allowed to hold Joint Hearings on Radon in Natural Gas from the Marcellus Shale coming to New York City. NYC public as well as health and energy policy makers must be given the opportunity to hear the concerns raised in relation to these issues and what the options are to protect public health. We look forward to working with you on this matter and request the favor of a reply.

Sincerely,

Barbara Arrindell, Director
Damascus Citizens for Sustainability - email: DCS@DamascusCitizens.org

Joe Levine, Director
NYH2O - email: info@NYH2O.org

Following are the additional signatories to June 1 letter requesting Joint hearings on Radon in Marcellus gas as of July 26, 2012 - complete June 1 letter is included with this second letter as are the actual letters sent from the Block Associations.

Chairman of the Board, Consolidated Edison, Kevin Burke
The Council of Chelsea Block Associations [CCBA] is a coalition comprised of 11 block associations representing 21 blocks active in the Chelsea Area of Manhattan. CCBA meets to review issues impacting our neighborhoods, arrive at positions that seek solutions to specific problems and strives to advance the general interests of our member block associations.

Dear Speaker Quinn, Chairwoman Arroyo, and Chairman Gennaro:

The Council of Chelsea Block Associations [CCBA] is sending you this e-mail communication for the purpose of asking you to hold joint hearings on a matter that is of concern to us. The issue relates to the potential health risks associated with the piping in of Marcellus shale gas to Manhattan and the impact it may have on the residents of our city because of the presence of radon in the gas.

CCBA invited two guests to our June 26th meeting, one from the Sane Energy Project and the other from the New York Chapter of the Sierra Club. They were asked to share information and their thoughts about the gas pipeline issue which has recently generated a lot of publicity and which has become a matter of controversy.

Also present were two of our CCBA members who are our organization's representatives to the Hudson River Park Trust Advisory Council [HRPTAC]. As you are aware, the HRPT Board recently voted to approve an easement for the proposed Spectra gas pipeline which is to run from Linden, New Jersey, to the west side of Manhattan, near West 14th Street. Our two advisory council members shared with us the reasons why the HRPT thought that the gas line would not pose a health problem.

With the input of the above mentioned attendees at our meeting, CCBA was able to talk about the pros and cons as to whether Marcellus gas should or should not be allowed to enter our city and become part of our kitchen environment through the use of our gas stoves, etc.

A lively discussion ensued with talk about the safety of the thickness of the pipes, the half life time it takes for the radioactive radon level to be diminished and no longer pose a health problem, is it in fact a health problem, if so, will it cause more illnesses than other sources of energy, what is a safe level, will there be real cost savings, will the workers installing the pipes be exposed to any danger, can there be a pipeline explosion and are we prepared to deal with one, if one happens.

Needless to say we did not get all the answers and lots of questions remain as to what if any dangers we New Yorkers might face if the pipelines come to fruition.
As a consequence of the uncertainty about this very important issue, the Council of Chelsea Block Associations is asking you to arrange for the appropriate City Council committees to schedule and hold hearings so that these very important health and energy issues can be addressed by the appropriate experts.

There is a saying, "Better safe than sorry." We have a lot to gain and nothing to lose by having City Council hearings.

We trust that you will act accordingly.

Thank you.

Sincerely,

Bill Borock, President
Council of Chelsea Block Associations

July 14, 2012

Dear Speaker Quinn, Chairperson Arroyo and Chairperson Gennaro,

**Waverly Place Association** hereby signs on to the letter from Damascus Citizens for Sustainability and NYH2O requesting public hearings to be held jointly by the City Council's Health Committee and Environmental Protection Committee on the issue of radon.

In addition, we want the NJ-NY Expansion Project, also known as the Spectra Pipeline, to be opened for public discussion, as this project potentially represents a separate threat to our safety.

Sincerely,

Tamara Totah
President, Waverly Place Association
President, The Flatiron Group LLC

Kenneth Picache
President, Chelan Advisors, LLC

FOLLOWING IS THE JUNE 1 LETTER WITH SIGNATORIES
The Honorable Christine C. Quinn  
Speaker, City Council of New York  
250 Broadway, Room 185  
New York, NY 10007  

June 1st, 2012

Re: Committee on the Environment and Committee on Health  
Joint Hearings on Radon in Natural Gas from the Marcellus Shale

Dear Speaker Quinn;

We are writing to request your assistance in holding joint hearings of the Committee on Environmental Protection and the Committee on Health as soon as possible on an environmental issue with very serious potential public health implications. As the proposals for the pipelines that will transport Marcellus shale gas to the New York area have come under public scrutiny, it has become apparent that the official government reviews have ignored one critical issue, the potential for exposing every New York household that uses natural gas to dangerous levels of radioactive radon. Until now, the issue of radon pollution in natural gas has been ignored in environmental impact documents and further brushed aside by the FERC in its public hearing processes.

There is every indication that Marcellus shale gas could become the predominant source of natural gas supplied to residential, commercial and industrial users in the New York City metropolitan area. Consolidated Edison, with support from the Mayor’s office, is actively promoting greater use of natural gas from the Marcellus shale area in response to the City’s determination to require a switch in building fuels from highly polluting number six fuel oil. Switching from Number 6 oil was a highly welcome step. Unfortunately, neither Con Ed, nor FERC, nor the City appear to have considered whether by promoting a switch to gas that will most likely come from the Marcellus area, they may be substituting a more serious pollution problem for the ones they are attempting to solve with this fuel switch.

Currently, this must be treated as a potential threat. There is a lack of definitive information in the public documents as to when, from where and how Marcellus shale gas will be brought into the City via various pipelines including the new Spectra pipeline to run from Linden, NJ, to Manhattan. However, there is every reason to believe that the Marcellus shale area may become the principal source of natural gas to the metropolitan area. Recent articles in the industry press have stressed the economic incentive with high cost fracked gas to minimize transmission costs by distributing the gas locally to the closest available major market. The new and upgraded pipelines in the Marcellus area now under consideration or construction are intended to collect gas from the Marcellus shale area and to bring it to the New York metropolitan area.

The consequences of introducing Marcellus shale gas into domestic natural gas markets in New York City could create a public health emergency, the potential for which neither the current City Administration nor Con Ed is taking seriously. It is the absence of such a systematic evaluation of whether Marcellus shale gas will be distributed in New York City and the lack of any formal
assessment of the public health risks of doing so that has led us to turn to the Council for leadership and support on this issue.

The basic science is straightforward. All natural gas produced from deep shale contains radon. Radon gas is highly carcinogenic and cannot be destroyed except by the process of radioactive decay. The United States Environmental Protection Agency has determined that exposure to radon is the leading cause of lung cancer among non-smokers, accounting for 21,000 fatalities per year on a nationwide basis. Exposure to the radon and its radioactive progeny from Marcellus natural gas could lead to thousands of additional cancer deaths in New York. Among the radioactive progeny are two radioactive solids, polonium and lead, that will stay in the lungs once inhaled or created when radon decays while inside the lung. Polonium decays by emitting high energy alpha particles that damage cellular DNA and create cancer cells. The radioactive lead decays by beta particle emission to create more radioactive polonium.

The reason for our concern is as follows. Most of the natural gas currently consumed in the New York metropolitan area comes from the Gulf Coast where the natural occurring level of radon at the well head is low, about 5 picocuries per liter. Moreover, it takes about six to eight days for the Gulf Coast gas to reach the New York area. The natural half-life of radon is 3.8 days (“half-life” is a physics concept that states how long it will take the process of radioactive decay to reduce the amount of radioactive material in half). This means that in the time it currently takes natural gas to reach New York, the radon level in the gas will decrease from about 5 picocuries per liter to about 1 picocurie per liter. While there is no “safe” level for exposure to ionizing radiation, EPA recommends taking mitigation measures if the radon level in a residence reaches 2 picocuries per liter or more. Consequently, current radon exposure levels across the metropolitan area are well below the EPA recommended action level.

Introduction of Marcellus shale gas into the New York metropolitan area will dramatically change the public health risks from radon exposure. Based on available scientific studies, Marcellus shale gas has one of the highest levels of radon found in any natural gas source in the United States, often exceeding 150 picocuries per liter at the well head. Moreover, the transit time from Marcellus shale gas fields to New York City via pipelines may be as short as 10 to 15 hours, resulting in only 10-15% decrease in radon levels by the time the gas reaches New York City. In other words, radon levels in gas delivered to New York City kitchen stoves and other gas-fired appliances could be in the range of 125 to 135 picocuries per liter. This would be a level 125 or more times existing exposure levels and over 60 times the EPA recommended level to initiate mitigation measures.

In addition to this increased exposure for New York residents, there are other sectors of the population who will have additional exposure to radiation from radon and its progeny. For example, workers performing maintenance on the natural gas distribution systems will be exposed to additional radiation from polonium when they remove pipes, valves, flanges and other equipment or clean scale from the inside of this equipment. Workers in the subway and other...
subterranean spaces would also have greater exposure when ambient radon levels in the outside air increase.

Introduction of Marcellus gas will pose an obvious health hazard to the residents and certain sectors of the work force of the New York metropolitan area. Thousands of additional cases of lung cancer could be the result. This risk must receive a proper health assessment. Frankly, we have been stunned that an administration that has the public health record and concerns of the current administration has been so seemingly indifferent to these potential risks. We hope the Council will not be and will address this issue before an irreversible commitment is made to this new Marcellus gas supply with its potential health risks.

We would also like to draw your attention to the financial risks that the City and Con Ed are running in dismissing this problem without proper consideration. There is not only the investment that might be made in an infrastructure that would have to be discarded, there is also the question of the City and Con Ed’s liability for the costs of health impacts and human suffering by those who have been exposed to radon distributed by Con Ed and promoted by the City. As we have seen in the tobacco litigation, these costs could ultimately total hundreds of millions of dollars for a population the size of New York City’s. We respectfully request that the Council and its relevant committees hold the necessary public hearings on this issue to insure that it is properly addressed by New York City health and energy policy makers. We look forward to working with you on this matter.
